### **Environmental Risk Assessment**

The purpose of this environmental risk assessment is to identify any actual or likely impact that the piggery may pose to the environment.

This provides the basis for reducing impacts (or risks of impacts) through improved design, improved management or monitoring.

There are three steps in this process:

- rate the vulnerability of the major natural resources and amenity
- rate the risk protection afforded by the major design and operational features of the piggery
- evaluate the likelihood of an environmental impact.

The following sections use this process to determine areas where there is a risk of environmental impacts.

### **Environmental Risk Assessment - Vulnerability Ratings**

### Soils of Reuse Areas

	Soils of Reuse Areas	
There	are on-site reuse areas at the piggery	
Rating Criteria	Response	Rating
Reuse areas are:	suited to growing a broad range of broadacre crops and pastures	1
Reuse areas have a soil depth of:	at least 1 m	1
The soils are:	loam to medium clay	1
The soils are:	non-rocky, non-saline and non-sodic	2
Reuse areas are:	not prone to waterlogging	1
The flooding frequency is:	less than once every ten years	1
Reuse areas have slopes that promo	te: infiltration, rather than runoff or erosion	1
OVERALL RATING	Soils of reuse areas are considered to be somewhat vulnerable	2

### **Environmental Risk Assessment - Vulnerability Ratings**

### Groundwater

Rating Criteria	Response	Rating
The depth to groundwater is:	always at least 5 m below the ground surface or the base of any piggery infrastructure	3
Water for potable use is:	not sourced from bores located within 1 km of the piggery	1
Groundwater is:	used in the piggery and there is ample allocation and supply that is of suitable quality to meet requirements	1
OVERALL RATING	Groundwater resources are considered to be vulnerable	3

### Environmental Risk Assessment - Vulnerability Ratings Surface Water

Rating Criteria	Response	Rating
The piggery is:	at least 200 m from the closest watercourse	1
It is:	at least 800 m from the closest water supply	1
The piggery is located:	above the 1-in-100 year flood line	1
Surface water is	not used in the piggery	1
Reuse areas:	comply with the buffer distances specified in the National Environmental Guidelines for Indoor Piggeries (NEGIP), and there are additional protection measures (eg. vegetative filter strips or terminal ponds) between these areas and the closest waterways	1
Reuse areas are located:	above the 1-in-10 year flood line	1
OVERALL RATING	Surface waters are considered to have low vulnerability	1

### **Environmental Risk Assessment - Vulnerability Ratings**

### Community Amenity

Rating Criteria	Response	Rating
The piggery has received:	less than two complaints per year (on average) over the past five years	2
Levels of odour; dust and noise around the property boundary	checked at least weekly	1
The piggery provides:	separation distances meeting the Level 1 criteria specified in Appendix A of the National Guidelines	1
Surrounding land is:	all designated rural, and is not designated for future development or rezoning	1
The piggery is:	well concealed from roads and neighbours	1
The entrance point to the farm provides:	at least 300 m good visibility in both directions	1
Vehicle movements and other noisy activities:	occur only during the day, except under exceptional circumstances	1
Mechanical equipment used on- farm is:	all fitted with manufacturer-specified exhaust devices	1
Dust from traffic movements, feed management and manure handling and reuse is:	controlled as needed	1
There is:	a complaints management procedure in place that includes complaints recording, investigation and corrective action, along with appropriate consultation	1
Mediation is:	used to try to settle disputes with neighbours	1
OVERALL RATING	Overall, community amenity is considered to be somewhat vulnerable	2

### **Design and Operation Risk Assessment**

### Pig Housing

	, igcusing	
This piggery	has conventional sheds	
This piggery	doesn't have deep litter shelters	
The pig accommodation	is not naturally ventilated	
Rating Criteria	Response	Rating
The sheds:	are oriented east-west and are constructed to maintain temperatures within the required range with no mechanical heating or cooling	1
Shed bases are:	concreted for conventional sheds and impervious for deep litter sheds (concreted or compacted for a permeability of 1 X 10-9 m/s for a depth of at least 300 mm)	1
The feeding systems:	minimise feed wastage	1
Stocking densities:	meet the requirement of the Model Code of Practice for the Welfare of Animals Pigs	1
The inflow and outflow of water from sheds is:	prevented by controls	1
Wash-down water is:	not generated by the piggery	1
Conventional sheds are:	frequently cleaned to maintain very clean lanes, pens and handling areas; pigs are clean	1
The bedding in deep litter shelters:	is always kept dry and friable (except for dunging areas); pigs are clean	1
OVERALL RATING	Overall, the design and management of the sheds minimises the likelihood of risks to the environment	1

	Effluent Collection System	
This piggery	has flushing channels	
This piggery	has static pits	
This piggery	has pull plugs	
Rating Criteria	Response	Rating
Stormwater runoff, including roof runoff:	is excluded from entering the effluent collection system (or the system is designed to handle the runoff)	1
Effluent collection systems an	e: concreted and impervious (no significant cracks)	1
Facilities pits, sumps, pipes and drains are:	sized and managed so that they do not spill	1
Maintenance of facilities that collect effluent	are self cleaning and very little manure is left in them after draining	1
Contingency measures. There are:	appropriate contingency measures to prevent spills from the system	1
Flushing channels are flushed	at least daily and static pits and pull plugs are emptied at least weekly (or in accordance with design requirements), with pits emptied in rotation to promote uniform loading of the effluent treatment system	1
Inspection of effluent	s inspected after each flush or drainage for solids accumulation, leakage and deterioration	1

## Design and Operation Risk Assessment Solids Separation System (pre-treatment of effluent) This piggery doesn't have a device (e.g. screen, screw press) that separates solids from the liquid effluent This piggery doesn't have an outloading bay

Not applicable and not assessed

OVERALL RATING

### **Design and Operation Risk Assessment**

### **Effluent Treatment System**

This piggery	has an on-site effluent treatment system	
Rating Criteria	Response	Rating
The effluent treatment system:	is designed to capture, treat, store and reuse all effluent; inlets and outlets are positioned to prevent short-circuiting	1
Odour. The effluent treatment system:	is designed and managed such that odour emissions are acceptably low	1
Sludge. The effluent treatment system:	designed to allow to store at least five years sludge	2
Design. The walls and bases:	have a design permeability of 1 X 10-9 m/s for a depth of at least 300 mm of compacted clay and pond depth does not exceed 2 m deep, 450 mm of compacted clay for ponds deeper than 2m, or is fitted with a well maintained impervious synthetic liner	1
The depth to the water table from the base of the effluent treatment system is:	at least 2 m	1
Freeboard. Depth to the water table from the base of the effluent treatment system is:	at least 600 mm is provided on any effluent treatment system	1
The effluent treatment system has a design overtopping frequency:	not exceeding 1 in 10 years where reuse is practiced, or not exceeding 1 in 20 years where effluent disposal is by evaporation	1
OVERALL RATING	Overall, the design and management of the effluent treatment system limits the likelihood of risks to the environment	2

### **Design and Operation Risk Assessment**

### Manure Storage

Rating Criteria	Response	Rating
Manure storage areas:	sit within a controlled drainage area, and all leachate and runoff is directed to effluent ponds, or storage designed to receive this inflow	1
The bases of manure storage areas are:	impervious; concreted or sealed for a design permeability of 1 $\rm X10\text{-}9\ m/s$ for a depth of 300 mm	1
The depth to water tables beneath the base of manure storage areas	exceeds 2 m at all times	1
Manure stockpiles/windrows are:	always managed to maintain low odour emissions	1
Spilt or spoilt feed is:	promptly cleaned up	1
OVERALL RATING	Overall, the design and management of the manure storage system minimises the likelihood of risks to the environment	1

la de la companya de	Design and Operation Risk Assessment	
	Manure Nutrients	
There	is on-farm reuse of effluent or manure	
Rating Criteria	Response	Rating
The quantities of nutrients reused are:	effluent and manure used on farm are measured and recorded each time reuse occurs, and each type of effluent or manure product used is tested at least annually	1
	Overall, knowledge about nutrient output minimises the likelihood	

### **Design and Operation Risk Assessment Design and Management of Reuse Areas** Effluent is irrigated on-site Manure is not spread on-site Rating Criteria Rating Response Weather. Effluent irrigations only when the soil is dry enough to absorb the water and when rain is not expected occur: 1 High pressure spray guns are: not used Gradient and Soil type. Flood Irrigation of effluent is: used only on sites with an even grade and loam or heavier soils, and with good flow control and runoff collection 1 Overall, the design and management of the reuse areas minimises the likelihood of risks to the OVERALL RATING 1 environment

### **Design and Operation Risk Assessment**

### **Mortalities Management**

	rendering	
	composting	
	burial	
	proper incineration	
	burning	
0	dumping	
Rating Criteria	Response	Rating
Dead pigs are:	always removed from the sheds or pens within 12 hours of discovery	1
Method of mortalities management:	rendering or composting	1
Timing of mortalities management:	always occurs within 24 hours of death	1
Mortalities managemen areas:	always provide at least 2 m depth between base level and groundwater; and are timpervious (e.g. concreted or sealed for a design permeability of 1 $\times$ 10-9 m/s for a depth of 300 mm)	1
Mortalities management. Carcasses that are composted or buried are:	always promptly covered with at least 300 mm of sawdust or alternative carbon source (if composting) or soil (if burying) and continuously kept covered	1
Mortalities management. Location of carcasses that are composted or buried or	occurs within a controlled drainage area with stormwater diverted away from the	
burned:	area	1
In the event of mass	a suitable site selected and a detailed management plan in place for managing mass mortalities, including emergency contact details	1
mortalities, there is:		

### **Design and Operation Risk Assessment**

### **Chemical Use and Storage**

Rating Criteria	Response	Rating
MSDS, emergency response plans for spills and spill kits or suitable clean up equipment are:	provided for all chemicals used	1
Quantities of chemicals stored on-farmare:	minimised	1
Chemicals with a low toxicity and low water contamination potential are:	preferentially selected	1
Chemicals are:	always stored and used in accordance with manufacturer's instructions, and legal requirements, and only in accordance with the registered use; records of use are maintained	1
Staff members are:	trained in correct handling and use of all chemicals of relevance to their position	1
Empty container and sharps disposal is	always in accordance with manufacturer's instructions	1
petroleum storage systems (UPSS) on- site:	applicable regulatory requirements for monitoring are always followed	1
Chemical contractors:	only accredited contractors are engaged	1

Overall, the management of chemicals minimises the likelihood of risks to the environment

OVERALL RATING

	Design and Operation Risk Assessment	
	Managing GHG Emissions	
GHG emissions	have not been considered in the design and operation of the piggery	
OVERALL RATING	Overall, the management of GHG emissions minimises the likelihood of risks to the environment 1	

### **Overall Risk Assessment**

		Natura	l Resource Vulne	erability Ratings	(1-4)
		Soils of Reuse Areas	Groundwater Quality & Availability	Surface Water Quality & Availability	Community Amenity
Design and Operation Risk Ratings (1-4)		2	3	1	2
Pig housing	1	2	3	1	2
Nutrient content of manure	1	2	3	1	2
Effluent collection system	1	2	3	1	2
Solids separation system	0	0	0	0	0
Effluent treatment system	2	4	6	2	4
Solid waste storage / treatment	1	2	3	1	2
Mortalities management	1	2	3	1	2
Reuse areas	1	2	3	1	2
Chemical use and storage	1	2	3	1	2
Managing GHG emissions	1	2	3	1	2

A combined rating of 1-4 means a low risk and would not trigger any action.

A combined rating of 5-11 means a medium risk and may trigger explanation or action.

A combined rating of 12-16 means a high risk and would trigger explanation or action.

Improving environmental performance might involve changes to design or management or further monitoring.

### **Environmental Monitoring and Assessment of Sustainability**

### Community Amenity

Management aims for the piggery to operate in harmony with the nearby community.

One measure of the impact of the piggery on nearby residents is the number of complaints received. Consequently, any complaints from either regulators or neighbours are taken seriously.

Receipt of a complaint triggers an investigation into the possible causes and corrective and / or preventative action as required.

Details of complaints received, investigations, findings of investigations, corrective and / or preventative actions taken and communications with

the party that lodged the complaint and / or the complainant are documented in a "Complaints Register".

The "National Environmental Guidelines for Indoor Piggeries" recommend soil monitoring frequencies based on the risk

Where there is high risk of soil impacts, annual soil monitoring is imperative.

If the risk is medium, and three years of annual monitoring data demonstrate the system is sustainable, soils should be sampled and analysed at least every two years.

If the risk is low, and three years of annual monitoring data demonstrate the system is sustainable, soils should be sampled and analysed at least every three years.

In this case the risk is:

2

Parameter

Depth

На

0-0.1 m

0.3-0.6 m or base of root zone

Electrical conductivity (ECcc)

0-0.1 m

0.3-0.6 m or 0.3-base of root zone

Available phosphorus

0-0.1 m

0.3-0.6 m or 0.3-base of root zone

Phosphorus sorption capacity

(monitor at depth yearly if sandy) 0-0.6 m or 0 m-base of root zone

or phosphorus sorption index

0.3-0.6 m or base of root zone

Organic carbon

Exchangeable cations and CEC

0-0.1 m

0.3-0.6 m or base of root zone

### Effluent and Manure

Before reuse, manure products are tested at least annually for the following parameters before the main reuse period.

### Effluent

Manure

Total nitrogen or TKN (Kjeldahl

nitrogen)

Dry matter

Total nitrogen or TKN (Kjeldahl

Ammonium-nitrogen Nitrage-nitrogen

sandy soils only

Electrical conductivity (EC) and

chloride

### Surface Water

Surface water monitoring is not warranted because there is no direct discharge to waterways and because secondary protection measures are in place.

Groundwater - ideally sample upslope

and downslope of source In this case the risk is:

0

Medium

Frequency (quarterly to bi-annually to annually)

1

Parameter Nitrate-nitrogen

Total phosphorus

High Risk Yes

Maybe

Med. Risk Maybe Maybe Maybe

Results of monitoring are interpreted against the National Environmental Guidelines for Indoor Piggeries and Action Plans

### **Contingency Plans**

Contingency plans are needed to address potential emergency situations that pose a risk to the environment. It is not possible to identify all possible emergency situations and further situations may be identified in the future. In the event of an emergency situation, the +61 407948291 24 hour contact phone number is: Loss of Water Supply A constant water supply is integral to the operation of the piggery. arrangements in place to obtain water from an To ensure a constant supply, the piggery alternative source Loss of Power is needed to operate the piggery and a back-up Power: generator is kept on-site. Interruption to Feed Supply To ensure a constant supply of feed: at least two days prepared feed is kept on-site Flooding is not a concern due to the location of the piggery Flooding: Fire In the event of a fire in, or near the piggery, staff safety is the highest priority. The local rural fire bridgade will be called take action to prevent the spread of the fire to If it is safe, piggery staff will: other buildings. Disease Outbreak In the event of a disease outbreak, piggery a local veterinarian management will contact: 0428270091 by telephoning: Mass Mortalities In the event of mass mortalities, piggery the Chief Veterinary Officer, EPA and Council management will contact: by telephoning: 0428270091 / 61 2 9995 5555 Chemical Spill In the event of a chemical spill: the spill kit is used **Biogas Risks** Leaking biogas could pose a number of risks including fire and explosion, adverse health risks for humans and animals and asphyxiation risks if released into confined spaces. Risk: management needs further consideration

N/A

In the event of a biogas leak, fire or explosion ensure staff are safe and contact emergency services and the gas safety

regulator for assistance:

### **NPI Reporting**

Piggeries trigger NPI reporting responsibilities if they emit over 10 t/yr ammonia, or for emissions to air from fuel or waste combustion exceeding 400 t/yr or 1 t/hr at any time in a reporting year.

NPI reporting is done on-line via: http://www.npi.gov.au/reporting

### **NGERS** Reporting

NGERS reporting is triggered by facilities that produce 25 kt of  $CO_2$ -e/yr of Scope 1 or 2 emissions or which use or produce over 100 TJ/yr of energy.

Further information is provided in Chapter 20 of the National Environmental Guidelines for Piggeries and at www.cleanenergyregulator.gov.au.

All reporting under the National Greenhouse and Energy Reporting Act 2007 is done through the Emissions and Energy Reporting System (EERS).

For more information, and to report, go to www.cleanenergyregulator.gov.au

### **EMP Review**

This EMP will be reviewed annually and also whenever significant changes in piggery design or management occur.

Records will be updated as needed.

### **Duty of Care for Off-Site Users**

Aged spent bedding and bedding compost from piggeries are great sources of nutrients for plant growth and carbon for building soil structure.

However, like inorganic fertilisers, they need to be spread on suitable areas and applied at sustainable rates to ensure the environment is protected.

Those utilising spent bedding or compost must take all reasonable and practical steps to prevent harm to the environment and to areas of cultural heritage sensitivity.

Each state has its own Acts detailing duty of care provisions. These typically require:

- · sustainable use of natural resources
- · conservation of biological diversity
- · avoidance of harm to Indigenous cultural heritage.

In particular, spreading of spent bedding or compost needs to be managed to avoid:

- · land degradation (e.g. soil erosion, decline in soil structure, nutrient overloading)
- odour and dust nuisance
- · surface water and groundwater pollution with nutrients and sediment
- · increased weeds
- · noise nuisance

To minimise the likelihood of these potential impacts:

- $\cdot$  minimise the risk of spent bedding or compost spillage during transportation by not overfilling the truck and by covering the load.
- · where practical, avoid transport routes with a large number of houses close to the road.
- · spent bedding and compost should not be stored or spread on areas that are flood-prone. Nor should they be stored or spread on areas where they will pose a significant risk of nutrient transfer to watercourses (e.g. sloping land immediately abutting a watercourse).
- · check the weather forecast before spreading spent bedding or compost and delay spreading if heavy rain is expected or the soil is still very wet following heavy rain. Also check the wind speed and direction to ensure the prevailing wind is not blowing directly towards nearby residences.
- · plan to spread spent bedding or compost from mid-morning to early-afternoon when good odour dispersion is likely. Avoid spreading from mid-afternoon to evening. Avoid spreading just before weekends or during holiday periods, particularly if close to a public area.
- determine a suitable spreading rate based on the N, P and K content of the spent bedding or compost, soil properties and the intended land use of the reuse area. The rate should be consistent with the ability of soils and plants grown on the area to sustainably use the applied nutrients, salts and carbon in the spent bedding or compost.
- · calibrate the spreader to spread at the target rate.
- $\cdot$  monitor reuse areas for weeds and control these if necessary. Although the aging and composting processes can destroy most weed seeds, some seeds may remain viable.
- avoid spreading spent bedding or compost close to sensitive neighbours at night when noise may create nuisance.
- · do not allow grazing stock to access stored manure or reuse areas for at least three weeks after spreading.

### **Pollution Data Monitoring Report**

Under the NSW *Protection of the Environment Operations Act 1997* (POEO Act), holders of environment protection licences (licensees) must publish or make pollution monitoring data available to members of the public.

The specific requirements for providing monitoring results are set out in section 66(6) of the POEO Act. In summary, this provision requires that:

- · licensees who undertake monitoring as a result of a licence condition must publish or make available pollution monitoring data within 14 days of obtaining the data and/or receiving a specific request for a copy of the data-
- $\cdot \ licensees \ who \ maintain \ a \ website \ must \ make \ the \ monitoring \ data \ related \ to \ pollution \ available \ in \ a \ prominent \ position \ on \ their \ website$
- · licensees who do not maintain a website must provide a free of charge copy of the pollution monitoring data on reasonable written request from any person
- the data must be published in accordance with requirements issued in writing by the EPA.

### Environmental Risk Assessment - Vulnerability Ratings Surface Water

Rating Criteria	Response	Rating
The piggery is:	at least 200 m from the closest watercourse	1
It is:	at least 800 m from the closest water supply	1
The piggery is located:	above the 1-in-100 year flood line	1
Surface water is	not used in the piggery	1
Reuse areas:	comply with the buffer distances specified in the National Environmental Guidelines for Indoor Piggeries (NEGIP), and there are additional protection measures (eg. vegetative filter strips or terminal ponds) between these areas and the closest waterways	1
Reuse areas are located:	above the 1-in-10 year flood line	1
OVERALL RATING	Surface waters are considered to have low vulnerability	1

### A. Statement of Compliance - Licence Details

ALL Licence holders must check that the Licence details in Section A are correct.

If there are changes to any of these details, you must advise Environment Protection Authority (EPA) and apply as soon as possible for a variation to your Licence or for a Licence transfer.

Licence variation and transfer application forms are available on the EPA website at: http://www.epa.nsw.gov.au/licensing-and-regulation/licensing or from regional offices of the EPA, or by contacting by telephone 02 9995 5700.

If you are applying to vary or transfer your Licence, you must still complete and submit this Annual Return.

### A1. Licence holder

### F. Statement of Compliance - Requirement to Publish Pollution Monitoring Data

Are there any conditions attached to your licence that require pollution monitoring to be undertaken as required under section 66(6) of the Protection of the Environment Operations (POEO) Act 1997?	Yes
Do you operate a website?	Yes
Is the pollution monitoring data published on your website in accordance with the EPA's written requirements for publishing pollution monitoring data?	Yes
Address of the web page where the pollution monitoring data can be accessed ▼	
www.picaustralia.com.au	

### **G. Statement of Compliance - Environment Management System and Practices**

Do you have an ISO 14001 certified Environmental Management System (EMS) OR any other system that EPA considers is equivalent to the accountability, procedures, documentation and record keeping requirements of an ISO 14001 certified EMS?	No
Have you conducted an assessment of your activities and operations to identify the aspects that have a potential to cause environmental impacts and implemented operational controls to address these aspects?	Yes
Have you established and implemented an operational maintenance program, including preventative maintenance?	Yes
Do you keep records of regular inspections and maintenance of plant and equipment?	Yes
Do you conduct regular (at least yearly) environmental audits at the premises that are conducted by a competent and independent person?	No
Have you undertaken an independent environmental audit covering documented environmental practices, procedures and systems in place during the annual return period?	No
Have you established and implemented an environmental improvement or management plan?	Yes
Do you train staff in environmental issues that may arise from your activities and operations at the premises and keep records of this?	No

### Hi Donna,

The data received during the week allows completion of the total reporting and monitoring for license 5471. Please find attachments to complete.

Please note......

- DPI (Wollongbar) is the best source of future analysis.
- P2 data is in line with previous years, but unless groundwater turns up before next year it will be dry.
- CS sample (end point storage) is similar to last test in 2008.
- CEC can only be done through a soil sample.
- The only overall watch is Piezometer South levels of trending nitrates. Otherwise all OK.

As a point of interest the oat crop on the licensed main irrigation has shown a reaction to something through a leaf burn during September. As a result I have sent some leaf tissue samples away to see if any analysis can determine anything. My guess is it looks like potassium burn during the dry pinch in early September. Crop has responded since rain events.

Regards,

Steve.
